

Instructions for re-installation of parking disc.

1. The parking disc is removed from the windscreen with a flat, non-scratching object. For example, a plastic putty knife.
2. Remove old glue residue from the windscreen and the parking disc.
3. Mount the new adhesive pads on the black points of the parking disc. Avoid touching the adhesive during installation. Do not remove the red protective film yet.
4. Clean the windscreen one last time with the supplied cleaning cloth. The windscreen must be free of adhesive residues after cleaning in point 2. Wipe the windscreen with a dry, lint-free cloth.
5. Now remove the red protective film from the adhesive pads on the parking disc. Place the parking disc in the lower right corner of the windscreen, within the area of the wiper field. (Please note that different countries might have different placement.) Press the parking disc firmly against the windscreen for at least 30 seconds. The temperature of the glass must be at least + 15°C to achieve the desired adhesive force. If necessary, use the air conditioner to heat up the windscreen.

NOTE! We only recommend using original adhesive pads for reassembling the parking disc. The product warranty is void in the event of a fault in the parking disc, which is due to shocks and impacts as a result of reassembly with non-original adhesive pads.
